AMENDMENTS TO THE CLAIMS

1. (Currently Amended) An apparatus for identifying a position of marked objects having

unknown positions and detecting a property of the marked objects contained in a specimen,

wherein the marked objects are marked with a fluorescent stain, the apparatus comprising

a frame,

a member positioned on the frame and having a surface that is adapted to receive and

hold the specimen,

at least a first light source for emitting at least a first light beam towards the specimen

held by the member, wherein the first light beam is adapted to provide a light spot having a

diameter between 20-150µm on the specimen,

at least a detector for detecting a light emitted from the marked objects upon interaction

with the first light beam, the first light source and the detector being arranged so that a part of a

light beam path from the first light source to the specimen is co-axial with a part of the light

emitted from the marked objects,

at least one beam-splitter being arranged to reflect the first light beam towards the

specimen and filter light emitted from the marked objects,

scanning means for scanning the entire surface of the member in relation to the detector

along a non-linear curve, wherein the scanning means comprises means for rotating the member

and means for displacing the member along a radius of the rotation of the member, so as to

identify the position of the marked objects in the entire specimen and detect the property of the

marked objects, the means for rotating and the means for displacing being directly connected to

Amendment dated October 30, 2007

Reply to Office Action of March 2, 2007

Page 3 of 15

the member, the member being rotatable and displaceable along a radius of the rotation of the

member,

scanning control means for controlling the scanning means for scanning the specimen

along the non-linear curve,

storage means for storing detector signals relating to the marked objects provided by the

detector and corresponding position signals provided by the scanning control means,

means for retrieving the position signals stored in the storage means, and

a microscope for viewing images of the marked objects,

wherein the scanning control means usinguses the retrieved position signals to place the

microscope at the position of the marked objects to allow performing a detailed examination of

the marked objects.

2-6. (Cancelled)

7. (Previously Presented) An apparatus according to claim 1, wherein the member is

positioned for rotation about an axis on the frame and wherein the means for rotating the member

rotates the member about the axis.

8. (Cancelled)

9. (Previously Presented) An apparatus according to claim 1, wherein the scanning

control means are adapted to control the scanning means in such a way that the non-linear curve

is a substantially circular curve.

10. (Cancelled)

11. (Previously Presented) An apparatus according to claim 1, further comprising means

for sampling and digitising the detector signals and the position signals.

12. (Previously Presented) An apparatus according to claim 1, further comprising signal

processing means operatively connected to the detector to detect a presence of an object based on

the detector signals.

13-14. (Cancelled)

15. (Previously Presented) An apparatus according to claim 1, wherein the specimen has

an area larger than 500 mm<sup>2</sup>.

16. (Previously Presented) An apparatus according to claim 1, wherein the specimen has

an area larger than 8000 mm<sup>2</sup>.

17-22. (Cancelled)

Birch, Stewart, Kolasch & Birch, LLP KM/GH/cl

Amendment dated October 30, 2007

Reply to Office Action of March 2, 2007

23. (Previously Presented) An apparatus according to claim 1, wherein a mask is inserted

Page 5 of 15

in an optical path between the specimen and the detector, and

the mask comprises at least one transparent aperture.

24. (Previously Presented) An apparatus according to claim 23, wherein the aperture

shape is a substantially rectangular shape.

25-26. (Cancelled)

27. (Previously Presented) An apparatus according to claim 1, wherein the first light

source is a coherent light source.

28. (Cancelled)

29. (Currently Amended) A method of identifying a position of a <u>fluorescently marked</u>

object having an unknown position and detecting a property of the object contained in a

specimen and comprising the steps of:

positioning the specimen on a member having a surface that is adapted to receive and

hold the specimen,

emitting at least a first light beam from a first light source towards the specimen held by

the member, wherein the first light beam is adapted to provide a light spot having a diameter

Birch, Stewart, Kolasch & Birch, LLP KM/GH/cl

between 20-150µm on the specimen, and wherein the first light beam is reflected by a beam-

splitter towards the specimen,

scanning the entire surface of the member in relation to a detector along a non-linear

curve by rotating the member holding the specimen and displacing the member along a radius of

the rotation of the member, the member being rotatable and displaceable along a radius of the

rotation of the member,

arranging the light source and the detector, so that a part of a light beam path from the

first light source to the specimen is co-axial with a part of a light emitted from the object,

filtering through said beam-splitter light emitted from the object,

detecting the light emitted from the object, thereby identifying the position of the object

and detecting the property of the object during scanning of the entire specimen,

storing detector signals relating to the object provided by the detector and corresponding

position signals provided by the scanning control means,

retrieving the position signals stored in the storage means,

placing a microscope at the position of the object using the retrieved the position signals

to allow performing a detailed examination of the object, and

optically inspecting the object by viewing an image of the object via the microscope by a

user.

30-35. (Cancelled)

KM/GH/cl

Amendment dated October 30, 2007

Reply to Office Action of March 2, 2007

36. (Previously Presented) A method according to claim 29, further comprising the step

of storing signals relating to the detected property and corresponding data relating to the current

position of the member.

37. (Previously Presented) A method according to claim 36, further comprising the step

of sampling and digitising the signals and the data.

38-43. (Cancelled)

44. (Previously Presented) An apparatus according to claim 1, wherein the detector

comprises a CCD device.

45-46. (Cancelled)

47. (Previously Presented) A method according to claim 29, further comprising

establishing identity of the object by viewing the image of the object.

48. (Previously Presented) An apparatus according to claim 1, wherein the position

signals of the marked objects are angular and radial coordinates.

49. (Previously Presented) A method according to claim 29, wherein the step of storing

the corresponding position signals includes storing angular and radial coordinates of the object

provided by the scanning control means.

50. (Previously Presented) A method according to claim 29, wherein the specimen has an

area larger than 500 mm<sup>2</sup>.

51. (Previously Presented) A method according to claim 29, wherein the specimen has an

area larger than 8000 mm<sup>2</sup>.
